15 **Abstract**

16 The Otolith Collection of Fishes from the Gulf of Mexico and Caribbean Sea was created
17 with the objective of conserving and illustrate the diversity of these structures from
18 species living in the Gulf of Mexico, the Caribbean Sea, and the freshwater and brackish
19 systems of the Yucatan Peninsula, incorporating morphological descriptions and
20 morphometric data. Otoliths, non-skeletal calcareous structures that develop in the inner
21 ear of fish, are essential for balance and hearing. They have become pivotal tools for age
22 and growth determination, population analysis, and ecological, trophic, and archaeological
23 studies due to their resistance to degradation and the extensive information they provide
24 about the environment and physiology of fish. The collection now includes otoliths from
25 214 species from 67 families, obtained through sampling campaigns and collaborations
26 with local fishermen. The otoliths are extracted using techniques that ensure the integrity
27 of the structures for later preservation. High-resolution images are obtained using optical
28 and scanning electron microscopy, and these images are stored in an online database.
29 This database facilitates research and teaching by providing public access to digital
30 specimens and associated data. In addition to fostering academic development, this
31 collection represents a significant step towards the creation of a national platform for
32 otolith data analysis, aligned with international efforts to digitize biological collections.
33 Despite the financial and logistical challenges involved in building and maintaining
34 biological collections, this collection demonstrates its value as an essential resource for
35 taxonomic, systematic, and ecological studies, as well as for biodiversity education and
36 awareness. The online availability of the collection not only facilitates access to data but
37 also promotes innovation and international collaboration in the study of fishes and their
38 habitats.

39

40 **Keywords:** Biological collection, digitization, fish, image analysis, online collection

41

42 **Introduction**

43 Throughout history, biological collections have played a fundamental role in documenting
44 the biodiversity of our planet. They provide essential information for the knowledge,
45 exploitation, and sustainable use of our biological capital, and they assist in the analysis
46 of trends derived from environmental changes. Additionally, they contribute necessary

47 information for studies on environmental health, epidemiology, and national security,
48 proving to be irreplaceable tools for investigating cases of biological terrorism (Suarez
49 and Tsutsui 2004) and determining the effects of anthropogenic activities (Izzo et al.
50 2018). The information generated from the analysis of specimens kept in biological
51 collections has motivated changes in public policies on the sustainable use of natural
52 resources, significantly impacting social welfare (National Academies of Sciences,
53 Engineering, and Medicine 2020).

54
55 Biological collections are not only essential repositories for taxonomic and systematic
56 work on the biota but also contribute to the development of other scientific disciplines.
57 They play a crucial role in education by raising awareness of the need to document and
58 conserve biodiversity and by enabling the development of new skills in research and data
59 analysis. Therefore, the role of biological collections transcends purely scientific
60 objectives and should be considered necessary tools that benefit society (Kellner 2024).

61
62 At different regional levels, collections maintain and catalog specimens of local
63 ecosystems, creating, preserving, and increasing information on species distribution,
64 identifying endemic or invasive species, and evaluating changes in biodiversity over time
65 (Meineke et al. 2018). Thus, biological collections are essential references in conservation
66 efforts, including those focused on endangered species and their habitats.

67
68 As fishes have been a group of interest for centuries, they are part of several biological
69 collections, notable for their diversity of forms and adaptations. Approximately 36893 fish
70 species are recognized (Fricke et al. 2024), equivalent to more than half of all living
71 vertebrates. Mexico, with its high diversity of fishes, boasts at least 2763 species
72 (Espinosa-Pérez 2014), of which 1816 are found in the Gulf of Mexico and the Caribbean
73 Sea (Robertson and Van Tassel, 2023). In this region, fishing activities by industrial and
74 artisanal fleets, along with recreational activities such as diving and sport fishing, are
75 depleting natural populations (De la Cruz et al. 2016). Given that many fish species
76 present on the Atlantic coast of Mexico have economic, nutritional, cultural, ecological, or
77 evolutionary importance, it is necessary to know the specific identity of organisms and
78 study aspects of their biology, ecology, and biogeography, underscoring the relevance of
79 scientific collections.

80
81 Although specimens deposited in ichthyological collections are useful for various research
82 purposes, their importance in paleontological, archaeological, and trophic studies is
83 particularly noteworthy. In trophic studies, for example, prey of piscivorous organisms are
84 often identified by examining stomach contents, vomit, or feces (Baker et al. 2024). This
85 methodology is limiting when the prey's degree of digestion is advanced. However, other
86 structures such as otoliths (Baker et al. 2014), which may be present in the digestive tract
87 of ichthyophagous organisms due to their resistance to degradation and retention of
88 original characteristics in many situations (Rivatón and Bourret 1999; Tuset et al. 2008),
89 can be recognized. In paleontology and archaeology, zooarchaeological remains,
90 including otoliths, are valuable for reconstructing environmental conditions, such as the
91 distribution and extent of water bodies, and recognizing the species used by ancient
92 cultures (Lin et al. 2022).

93
94 Otoliths are non-skeletal calcareous concretions (Nolf 1985; Maisey 1987) that grow
95 within the vestibular system of vertebrates, particularly in the membranous labyrinth of the
96 inner ear. In bony fish, the inner ear consists of three semicircular canals and three otic
97 chambers, each housing an otolith. Depending on the chamber in which they are located,
98 otoliths are called sagitta (in the sacculum), lapillus (in the utricle), and asteriscus (in the
99 lagena). These structures play a crucial role in balance, orientation, and sound detection
100 (Platt and Popper 1981; Gauldie and Nelson 1988; Campana and Thorrold 2001). Otoliths
101 are composed of calcium carbonate (CaCO_3) in the form of aragonite and other inorganic
102 salts, with crystals embedded in an organic matrix composed of a fibrous protein called
103 otolin, deposited concentrically around a nucleus (Martínez-Pérez et al. 2018). The
104 presence of several elements is related to metabolically regulated processes and is
105 influenced by both endogenous and exogenous factors. Therefore, otoliths can provide
106 information on the physiological aspects of organisms and the environments in which they
107 developed (Volpedo and Echeverría 2003). These characteristics have made otoliths key
108 tools in research on age and growth (Francis and Campana 2004), population dynamics,
109 trophic studies, archaeological analyses, and present and past environmental conditions.

110
111 Sagittae have a particular morphology that varies among species, making them useful as
112 auxiliary structures in organism identification and for distinguishing between
113 phylogenetically close species (Volpedo and Echeverría 2003). Analyzing the shape, size,
114 and structural characteristics of otoliths not only allows for species identification but also
115 helps investigate evolutionary relationships and reconstruct phylogenetic histories.

116
117 Rojo (2015) emphasized the importance of incorporating otoliths into fish collections, as
118 they enable the extraction of biological information about species that is otherwise
119 unattainable through the analysis of other structures such as spines, scales, or bones.
120 Otoliths store unique data on the life history of organisms and the environmental
121 conditions of their habitats. It is in this context that the Otolith Collection of Fishes from
122 the Gulf of Mexico and Caribbean Sea was created and registered with the Mexican
123 Ministry of Environment and Natural Resources (SEMARNAT, registration code DGVS-
124 CC-305-18).

125
126 The main objective of this collection is to preserve otoliths of a wide variety of species,
127 including those of economic and ecological importance, as well as endangered and
128 endemic species from the Gulf of Mexico and Caribbean Sea, and freshwater and
129 brackish systems of the Yucatan Peninsula. The addition of the Mexican Atlantic Fish
130 Otolith Collection (Martínez-Pérez et al. 2011; Del Moral-Flores et al. 2016) and proper
131 curation and maintenance have turned this collection into a national reference,
132 contributing to research in disciplines such as biology, ecology, biogeography,
133 archaeology, and fisheries, among others. To enhance this purpose and facilitate access
134 to specimens and other resources such as databases or software for shape analysis, this
135 collection is available online. Public access to information is thus guaranteed, scientific
136 collaboration is encouraged, and educational and training opportunities are improved
137 (Monfils et al. 2017), extending these benefits to a wide geographical extent.

138

139 **Methods**

140 *Specimen collection*

141 Since 2011, multiple campaigns have been conducted in various localities of the Gulf of
142 Mexico and the Caribbean Sea to obtain bony fish specimens, which serve as the primary
143 input of biological material. Specific sampling methods have been employed, involving
144 different fishing gears operated under catch permits obtained from the competent
145 authorities. Additionally, visits have been made to markets, fish markets, and ports, and
146 agreements have been established with fishermen from different areas to direct sampling
147 efforts towards certain species of interest. The Otolith Collection of Fishes from the Gulf of
148 Mexico and Caribbean Sea has been enriched by the addition of the Mexican Atlantic
149 Fish Otolith Collection (Martínez-Pérez et al., 2011; Del Moral-Flores et al., 2016).

150
151 It is important to note that otolith extraction requires that the specimens be fresh or frozen,
152 as otoliths preserved in unneutralized formalin or alcohol degrade, reducing the chances
153 of correct identification (Hecht, 1990) and limiting their usefulness as collection
154 specimens.

155
156 After collection, each fish is identified to the species level using taxonomic keys and
157 guides. Biometric data, such as total length (TL), standard length (SL), cephalic length
158 (CL), body height, weight, and, when possible, sex, are recorded for each specimen.
159 Capture data, including locality, date, and geographic coordinates, are also documented.

160
161 *Otolith extraction*

162 Two techniques are employed for otolith extraction. One method involves lifting the
163 operculum, removing the gills, and breaking the bony capsules to expose and extract the
164 otoliths with forceps. The other method involves separating the head from the body,
165 removing the gill arches and surrounding tissue to locate the bony capsules. The blades
166 of a pair of scissors are inserted into the center of the first vertebra, using them as a lever
167 to lift the ventral bone of the capsule and expose the otoliths. These procedures are
168 performed under a stereoscopic microscope.

169
170 Once extracted, the otoliths are cleaned of residual tissue, and detailed morphometric
171 measurements, including perimeter, area, height, width, and acoustic sulcus dimensions,
172 are obtained using Zen Pro software (Zeiss). These data allow for the calculation of
173 different morphometric indices useful in species comparison.

174
175 The terminology used for the morphological descriptions of sagittae is derived from the
176 works of Volpedo and Echeverría (2000), Mascareñas-Osorio et al. (2003), Tuset et al.
177 (2008), and Martínez-Pérez et al. (2018).

178
179 Otoliths are stored in vials labeled with biometric and capture data, including a unique
180 identification code for each specimen. The vials are placed in boxes, which are labeled
181 and stored in the collection under controlled temperature and humidity conditions to
182 ensure long-term preservation.

183
184 *Digitization of the collection*

185 The digitization of the Otolith Collection of Fishes from the Gulf of Mexico and Caribbean
186 Sea is a key component in improving the accessibility and usefulness of the stored
187 specimens. This collection includes a photographic archive of approximately 2600 otolith
188 images obtained using optical and scanning electron microscopy techniques. These
189 images are used not only for documentation and preservation but also to facilitate
190 research and comparative analysis.

191
192 High-resolution images of the otoliths are obtained using an advanced Zeiss AxioZoom
193 stereo microscope, which provides continuous magnification and excellent depth of field,
194 crucial for capturing the morphological details of the structures. These images are used
195 for both taxonomic identification and morphometric studies. Additionally, a scanning
196 electron microscope (Jeol 7600F FESEM) is used to obtain high-resolution images with a
197 large depth of field, allowing for the visualization of ultrastructural details of otoliths not
198 perceptible with optical microscopy. This equipment is essential for studies requiring
199 detailed analysis of the otolith surface and its microstructures.

200
201 Images are selected to highlight the distinctive characteristics of each otolith, with angles
202 and focus optimized for this purpose. Each image is edited to standardize the black
203 background, enhancing contrast and facilitating the visualization of morphological details.
204 A watermark with the collection logo is added to each image to ensure provenance and
205 maintain the collection's identity.

206
207 The digitized images are stored in a database management system that allows easy
208 access and retrieval. Each image is associated with the biometric and capture data of the
209 corresponding specimen, including the unique identification code.

210 211 **Results**

212 *Physical specimens*

213 The Otolith Collection of the Gulf of Mexico and Caribbean Sea comprises 3001 lots,
214 representing 214 species from 67 families (Table 1). Sciaenidae is the most represented
215 with 17 species, followed by Carangidae and Haemulidae, with 15 and 11 species,
216 respectively.

217
218 The species with the highest number of specimens in the collection are *Menticirrhus*
219 *americanus* (Linnaeus, 1758) with 191 lots, *Ariopsis felis* (Linnaeus, 1766) with 108 lots,
220 *Bagre marinus* (Mitchill, 1815) with 106 lots, and *Haemulon plumierii* (Lacepède, 1801)
221 with 102 lots. Each lot typically contains all three pairs of otoliths: sagitta, asteriscus, and
222 lapillus.

223
224 The collection includes otoliths from specimens collected along the coasts of the states of
225 Tamaulipas, Veracruz, Campeche, and Yucatan, which is the best-represented state with
226 1700 lots, followed by Campeche with 894 lots and Veracruz with 368 lots. Additionally,
227 the collection contains 23 lots of otoliths from Cuba.

228
229 Fig. 1 illustrates the sagittal otoliths of most of the families included in the collection.
230 These images on the collection's web page are accompanied by morphological

231 descriptions and morphometric characteristics such as length, height, perimeter, and area
232 of both the sagitta and the acoustic sulcus. These variables allow for the calculation of
233 shape indices, including circularity, rectangularity, aspect ratio, and the proportion of the
234 area occupied by the acoustic sulcus. The diversity of the shape of the saccular otoliths is
235 notable, ranging from simple ellipsoids to complex patterns with species-specific
236 projections and invaginations. The dorsal and ventral margins can be smooth, scalloped,
237 lobed, serrated, or serrate. The anterior and posterior regions exhibit significant variability,
238 being pointed, angulated, rounded, truncate, oblique, lanceolate, bilobed, double-pointed,
239 or irregular. Many species have an indentation in the anterior region, the ostial fissure,
240 which delineates the rostral and antirostral regions. The characteristics of the fissure,
241 whether deep or shallow, angulated or rounded, affect the shape and size of these
242 sections. The acoustic sulcus, a longitudinal depression along the medial face of the
243 sagitta, consists of the ostium anteriorly and the cauda posteriorly. In some instances,
244 thickening of the edges, known as cristae, and dorsal or ventral depressions are present
245 along the acoustic sulcus.

246

247 *Website*

248 The online catalog of the Fish Otolith Collection of the Gulf of Mexico and Caribbean Sea
249 aims to organize and present the information in a user-friendly yet comprehensive
250 manner, available to academics, students, and anyone interested in fish biology and
251 ecology.

252

253 The website features a detailed database with information on each otolith, including
254 species, location, size and weight of the specimen, collector, and morphological
255 parameters of the otolith. It also includes a gallery of images or scientific illustrations of
256 the species and photographs of the otoliths obtained through optical and electron
257 microscopy. Detailed morphological descriptions of the left sagitta of each species are
258 accessible.

259

260 Before publication on the website, the quality of the digital data is verified to ensure high-
261 value information that can positively impact research and education.

262

263 To facilitate consultation, the webpage offers search functions by taxon (family, genus, or
264 species) and keywords related to otolith characteristics. Additionally, didactic resources
265 such as videos on otolith extraction and description techniques, and the use of relevant
266 equipment for their study are available. The otolith collection webpage can be accessed
267 at <https://otolitos.unam.mx>.

268

269 *Publications and analytical tools*

270 Derived from the curatorial work of the collection and the information on each specimen, a
271 catalog with descriptive cards of the sagittal otoliths of 155 fish species from the Gulf of
272 Mexico was published (Martínez-Pérez et al., 2018). This catalog includes standardized
273 descriptions of the shape, as well as some morphometric data of the structure, acoustic
274 sulcus, and shape indices. Currently, a second edition of the catalog is being prepared,
275 which will include information on species added in recent years.

276

277 Additionally, a software, Invariant Otolith Shape Analysis (IOSA), which can be
278 downloaded here, <https://sites.google.com/view/jorge-perez/community#h.hh1lv19s6hli>)
279 has been developed to automatically obtain morphometric descriptors and shape
280 invariants of otoliths from their images, based on the methodology proposed by Hevia-
281 Montiel et al. (2021).

282
283 Recently, the collection has been used to corroborate the presence of fish remains in the
284 Mayan archaeological record. This information will deepen our understanding of pre-
285 Hispanic fishing practices and infer possible changes in some fish populations in the
286 region.

287 288 **Discussion**

289 The Otolith Collection of the Gulf of Mexico and Caribbean Sea is a sample of the
290 richness and ichthyological diversity of the region. It has a collection of 214 species
291 belonging to 67 families, which represent a significant percentage (just over 11%) of the
292 total number of species recorded for the Gulf of Mexico and the Caribbean Sea.
293 (Robertson and Van Tassel, 2023). The families and species most represented in the
294 collection reflect the specific composition of the local ichthyofauna, its ecological
295 importance, and its relevance to the regional economy. This extensive taxonomic
296 representation provides an invaluable database for biodiversity, taxonomy, and
297 systematic studies of fishes in the region.

298
299 The otoliths in this collection come from specimens obtained in various geographic
300 regions, enabling the study of species distribution and population variability in different
301 localities of the Gulf of Mexico and the Caribbean. With 3001 lots in total, the collection
302 provides a robust data set for statistical analyses, intraspecific variability studies, and
303 temporal trend evaluations.

304
305 Otoliths are invaluable in paleontological, archaeological, and biological explorations,
306 such as analyzing the stomach contents of piscivorous species. Reference collections
307 have been established to assist in species identification from remains found in
308 archaeological contexts, as documented by Disspain et al. (2016) and Lambrides et al.
309 (2024). The catalogs by Mascareñas et al. (2003) and Martínez-Pérez et al. (2018), along
310 with the website www.otolitos.unam.mx, support research efforts in Mexico.

311
312 The digitization of biological collections, including the Otolith Collection of the Gulf of
313 Mexico and Caribbean Sea, is crucial for making scientific information universally
314 accessible. Digitization transforms specimen information into digital formats, allowing for
315 easy access and analysis by anyone with an internet connection. This approach
316 modernizes the use of biological collections, eliminating the need for physical travel or
317 loan requests, which risk loss or damage to the specimens.

318
319 Digitization also fosters new research topics and addresses global challenges related to
320 climate change, food security, and conservation (Soltis, 2017). The online presence of the
321 Otolith Collection makes it the first digital otolith collection in Mexico, facilitating
322 international collaboration and knowledge dissemination. This effort aligns with global

323 initiatives like the "Integrated Digitized Biocollections" (iDigBio), the "European Distributed
324 System of Scientific Collections" (DiSSCo), and the "Innovation and Consolidation for
325 Large Scale Digitization of Natural Heritage" (ICEDIG). These programs promote the
326 networking of collections worldwide, contributing to the "global museum" concept (Bakker
327 et al., 2020).

328
329 Despite the benefits of digitization, physical specimens remain the primary source of
330 verifiable data. Digital information complements but does not replace physical specimens.
331 Increased online accessibility often leads to more visits to collections and loan requests
332 for physical specimens (Vollmar et al., 2010). Therefore, preserving physical specimens in
333 optimal conditions is a primary task for the curatorial staff of the Otolith Collection.

334
335 Additionally, the webpage offers accessible image processing software that employs
336 invariant descriptors, as detailed by Hevia-Montiel et al. (2021). These descriptors are
337 independent of rotation, scale, or translation, thereby ensuring consistent results. This
338 software provides additional information beyond traditional descriptors, such as otolith
339 area or perimeter (Hevia-Montiel et al., 2021), which is particularly beneficial in taxonomic
340 studies that rely on limited structures for species identification. By offering a user-friendly
341 interface that allows the application of image processing through a webpage, the tool
342 significantly broadens its user base. Enhancing collaboration is crucial, especially in
343 studies involving these structures, where there is an increasing demand for web-based
344 tools that enable researchers to browse and search images and data in conjunction with
345 biological analyses.

346
347 The contributions of biological collections to knowledge, education, and innovation are
348 immense but often unrecognized (National Academies of Sciences, Engineering, and
349 Medicine, 2020; Kellner, 2024). Many scientific communities have highlighted the risks of
350 inadequate funding for maintaining the infrastructure necessary for the proper functioning
351 of these collections (Finkel, 2024; Kellner, 2024). Thus, the online presence of the Otolith
352 Collection is a vital step toward creating a national platform that supports the analysis of
353 bony fish otoliths in various contexts, including paleontological, archaeological, biological,
354 and ecological studies (Begg et al., 2005; Disspain et al., 2016).

355 356 **Conclusion**

357 Otoliths serve multiple research purposes, including paleontological, archaeological, and
358 biological explorations, and support species identification in archaeological contexts. The
359 Otolith Collection of the Gulf of Mexico and Caribbean Sea represents the ichthyological
360 diversity of the region, encompassing 214 species of 67 families, reflecting over 11% of
361 the total species richness in the region. The collection's species composition mirrors the
362 local ichthyofauna's ecological importance and its significance to the regional economy,
363 making it a crucial resource for biodiversity studies.

364
365 With specimens collected from various regions, the collection provides valuable data for
366 studying species distribution, population variability, and temporal trends in the Gulf of
367 Mexico and the Caribbean. Furthermore, digitizing the Otolith Collection enhances global
368 accessibility, facilitates international collaboration, and supports research on critical global

369 challenges, such as climate change and conservation. The collection's website offers
370 innovative image processing software that improves species identification and taxonomic
371 studies, making these tools widely accessible to researchers. It is important to note that
372 while digitization expands access to the collection, physical specimens remain the primary
373 source of verifiable data, highlighting the need for their preservation. Therefore, we
374 emphasize the importance of adequate funding for maintaining this and other biological
375 collections, as they contribute significantly to knowledge, education, and innovation.
376

377 **Acknowledgments**

378 The authors wish to express their gratitude to the many students (especially Kylie López
379 Castillejos, Alt Gerardo Palacios Díaz, Diego Muñoz Pérez, José Emilio García Pérez,
380 Jonathan de la Cruz), fishermen (especially Fernando Mex and Enrique Mex), and
381 colleagues (especially Daniel Arceo Carranza, Claudia Durruty Lagunes, Manuel
382 Valenzuela Jiménez) who participated in the collection of scientific material, laboratory
383 work, analysis, and curatorship of the Otolith Collection from the Gulf of Mexico and
384 Caribbean Sea. We appreciate the generous donation of the Mexican Atlantic Fish Otolith
385 Collection by José Antonio Martínez Pérez from the Facultad de Estudios Superiores
386 Iztacala, Universidad Nacional Autónoma de México. This project was funded by PAPIIT-
387 DGAPA-UNAM (IG201121).

 613

614 **Table**

615

616 **Table 1.** List of species of the Otolith Collection of the Gulf of Mexico and the Caribbean
 617 Sea. Taxonomic classification according to Van der Laan et al. (2024). The size range
 618 of the specimens corresponds to the total length (TL), except in some cases where the
 619 standard length (SL) is used (*).
 620

| Family | Species | Number of specimens | Size range (mm) |
|---------------|---|---------------------|-----------------|
| Lepisosteidae | <i>Atractosteus tropicus</i> (Gill, 1863) | 2 | 540-593 |
| Elopidae | <i>Elops saurus</i> Linnaeus, 1766 | 38 | 87-613 |
| Megalopidae | <i>Megalops atlanticus</i> (Valenciennes, 1847) | 2 | *385-426 |
| Albulidae | <i>Albula vulpes</i> (Linnaeus, 1758) | 6 | 351-292 |
| Ophichthidae | <i>Ahlia egmontis</i> (Jordan, 1884) | 1 | 365 |
| Engraulidae | <i>Anchoa cayorum</i> (Fowler, 1906) | 7 | 90 |
| | <i>Anchoa cubana</i> (Poey, 1868) | 2 | *55 |
| | <i>Anchoa lamprotaenia</i> (Hildebrand, 1943) | 34 | 89-130 |
| | <i>Cetengraulis edentulus</i> Cuvier, 1829 | 9 | *94-140 |
| Clupeidae | <i>Dorosoma petenense</i> (Günther, 1867) | 6 | *104-140 |
| | <i>Harengula clupeola</i> (Cuvier, 1829) | 10 | 51.47-130 |
| | <i>Harengula jaguana</i> Poey, 1865 | 15 | 110-160 |
| | <i>Opisthonema oglinum</i> (Lesuer, 1818) | 24 | 33-250 |
| | <i>Sardinella aurita</i> Valenciennes, 1847 | 3 | *156-163 |
| Cyprinidae | <i>Ctenopharyngodon idella</i> (Valenciennes, 1844) | 1 | 261 |
| Characidae | <i>Astyanax altior</i> Hubbs, 1936 | 23 | 55.7-79.1 |
| Heptapteridae | <i>Rhamdia guatemalensis</i> (Günther, 1864) | 4 | 91.5-1293 |
| Ariidae | <i>Ariopsis felis</i> (Linnaeus, 1766) | 108 | 56-402 |
| | <i>Bagre marinus</i> (Mitchill, 1815) | 106 | 267-540 |
| Synodontidae | <i>Saurida brasiliensis</i> Norman, 1935 | 2 | *184-203 |
| | <i>Synodus foetens</i> (Linnaeus, 1766) | 22 | 52.4-376 |
| Phycidae | <i>Urophycis floridana</i> (Bean & Dresel, 1884) | 5 | 256-327 |
| Holocentridae | <i>Holocentrus adscensionis</i> (Osbeck, 1765) | 5 | 92-280 |
| | <i>Holocentrus rufus</i> (Walbaum, 1792) | 2 | 110-115 |
| | <i>Myripristis jacobus</i> Cuvier, 1829 | 2 | 166-180 |

| | | | |
|-----------------|--|-----|-----------|
| Ophidiidae | <i>Brotula barbata</i> (Bloch & Schneider, 1801) | 3 | 372-550.8 |
| | <i>Ophidion holbrookii</i> Putnam, 1874 | 3 | 77-141 |
| Batrachoididae | <i>Opsanus beta</i> (Goode & Bean, 1880) | 6 | *98-205 |
| | <i>Opsanus dichrostomus</i> Collette, 2001 | 2 | 105-130 |
| | <i>Sanopus reticulatus</i> Collette, 1983 | 12 | 280-590 |
| Pomatomidae | <i>Pomatomus saltatrix</i> (Linnaeus, 1766) | 8 | 420-524 |
| Scombridae | <i>Euthynnus alletteratus</i> (Rafinesque, 1810) | 1 | 450 |
| | <i>Scomberomorus brasiliensis</i> Collette, Russo & Zavala-Camin, 1978 | 5 | *290-360 |
| | <i>Scomberomorus cavalla</i> (Cuvier, 1829) | 4 | 695-750 |
| | <i>Scomberomorus maculatus</i> (Mitchill, 1815) | 4 | 480-590 |
| Trichiuridae | <i>Trichiurus lepturus</i> (Linnaeus, 1758) | 8 | *268-884 |
| Dactylopteridae | <i>Dactylopterus volitans</i> (Linnaeus, 1758) | 3 | 86-92 |
| Mullidae | <i>Mulloidichthys martinicus</i> (Cuvier, 1829) | 2 | 250-268 |
| | <i>Pseudopenaeus maculatus</i> (Bloch, 1793) | 1 | 223 |
| | <i>Upeneus parvus</i> Poey, 1852 | 3 | *115-145 |
| Callionymidae | <i>Chalinops pauciradiatus</i> (Gill, 1865) | 6 | 27.2-36.9 |
| Eleotridae | <i>Dormitator maculatus</i> (Bloch, 1792) | 6 | 45-90 |
| | <i>Gobiomorus dormitor</i> Lacepède, 1800 | 6 | *147-186 |
| Gobiidae | <i>Awaous banana</i> (Valenciennes, 1837) | 2 | *51-62 |
| | <i>Gobionellus oceanicus</i> (Pallas, 1770) | 5 | *93-159 |
| | <i>Gobiosoma robustum</i> (Ginsburg, 1933) | 6 | 28.2-36.3 |
| Centropomidae | <i>Centropomus parallelus</i> Poey, 1860 | 3 | *158-181 |
| | <i>Centropomus undecimalis</i> (Bloch, 1792) | 25 | 370-473 |
| Sphyraenidae | <i>Sphyraena barracuda</i> (Edwards, 1771) | 22 | 247-1015 |
| | <i>Sphyraena guachancho</i> Cuvier, 1829 | 9 | *148-583 |
| Polynemidae | <i>Polydactylus octonemus</i> (Girard, 1858) | 3 | *78-195 |
| Cyclopsettidae | <i>Cyclopsetta chittendeni</i> Bean, 1895 | 117 | 218-315 |
| | <i>Cyclopsetta fimbriata</i> (Goode & Bean, 1885) | 51 | 77-390 |
