Abstract
Climatic conditions and physical features of the Eastern Himalayan region encompasses a rich diversity of lichen biota. However, the region’s lichens are still far from extensively explored. Here, we study the genus Pyrenula Ach. from the Dhubri district of Assam in North-East India. Twelve species of Pyrenula have been recorded, of which one of the species, P. chlorospila (Nyl.) Arnold, is a newly reported from India. Morphotaxonomic comments on this species, emphasizing its distribution, are provided.

Keywords
New record, North-East India, taxonomy

Introduction
The number of lichens known from India continues to increase and currently 2963 species in 468 genera and 84 families are known (Sinha 2021). India has rich diversity of pyrenocarpous lichens, with about 382 species in 49 genera and 12 families. The warm, moist conditions in the Eastern Himalaya, including Assam, favours a rich diversity of pyrenocarpous lichens of about 295 species (Mishra et al. 2020). Generally, these lichens grow on tree bark, rocks, soil, and leaves. Trees having smooth, shaded bark are the most preferred. Among the pyrenocarpous lichens, the family Pyrenulaceae is dominant with Pyrenula Ach. the dominant genus. Aptroot (2012) listed 745 species of Pyrenula worldwide. The genus is characterized by an olivaceous green or brownish to yellowish thallus. Pseudocyphellae and maculae may be or may not be present. The ascocarp is of the perithecia type, which may be covered by the thallus or naked in upper part solitary or rarely 2 or 3 confluent. The peridium is carbonized and either spreading laterally or not. The ostioles are apical or lateral, and the paraphyses are simple and rarely branched. Each asci bears eight spores. Ascospores are brown and transversely septate or
muriform, with or without lichexanthone and anthraquinones (Awasthi 1991, Ingle 2018). Upreti (1990, 1991a, 1991b, 1992, 1993) made extensive revisionary studies on the Pyrenula of India and described several new species, as well as reports of species from the country. Jagadesh Ram et al. (2005) newly described Pyrenula sub cylindrica Jagadesh & Upreti from India. Thus, India is represented by 83 species of Pyrenula and greatest diversity of species is reported from the Western Ghats and the Eastern Himalayan Region (Mishra et al. 2020; Rajaprabu et al. 2021). Among the northeastern states, Assam is one of the states with significant number of lichen studies and novel species reports from India. Altogether, 525 species of lichens have been reported from Assam, of there are 59 Pyrenula species (Daimari 2016; Gupta and Sinha 2018; Gogoi et al. 2019, 2020; Behera et al. 2021). Gupta and Sinha (2018) compiled lichens from the state and mentioned P. acutalis R.C. Harris found in the Dhubri district as part of an ongoing study.

Methods

Lichen specimens were collected from 15 locations in the Dhubri district in Assam state. The specimens were collected from the bark of trees, then air dried and stored in acid free paper packets. They were identified morphologically, anatomically and chemically. The morphological characters were studied under a Leica EZ4W stereozoom microscope. For examining anatomical characters, thin sections of the perithecia were mounted in water and observed under a Leica DM 750 compound microscope. The presence of chemical substances was analyzed by performing thin-layer chromatography (Orange et al. 2001) and colour tests using KOH (K), para-phenylenediamine (P) and Calcium hypochlorite (C) solutions. Lichen thallus were also observed under ultraviolet light. The specimens were identified to species following Aptroot (2012) and Upreti (1998) and deposited in the Bodoland University Botanical Herbarium, (BUBH), Department of Botany, Bodoland University (Kokrajhar, Assam, India). A set of voucher specimen is deposited in the herbarium of CSIR–National Botanical Research Institute, LWG; Lucknow Uttar-Pradesh, India.

Results

Pyrenula chlorospila (Nyl.) Arnold

Figure 2A–C

Specimens examined. INDIA – Assam • Dhubri district, Bidyadabri part v; 26°26ʹ11ʹʹN, 089°47ʹ11ʹʹE; 34m alt; 21. XII. 2020; S. Biswas & P. Biswas leg.; on the bark of Lannea sp. • 2020-0280 (BUBH) • Dhubri district, Debotar hasdaha part 4; 26°05ʹ79ʹʹN, 089°83ʹ083ʹʹE; 30.23 m alt; 22. XI. 2020; S. Biswas & P. Biswas leg; on the bark of Lannea sp.; 2020-0400 (BUBH), 61701 (LWG).

Description. Thallus crustose, corticolous, yellowish; pseudocyphellae present; maculae absent; perithecia numerous, black; ascomata 0.15–0.20 mm in diameter; ostiole white, apical to lateral; peridium black, carbonized, spreading laterally; hamathecium not inspersed, ; hymenium clear; asci 8- spored; ascospores brown, transversely 3-septate; middle locules diamond-shaped and terminal locules triangular with their base towards the end, 26–30 ×10–12 μm.

Chemistry: Thallus K–, C–, P–, TLC–no chemical present.

Figure 1. Geographic distribution of Pyrenula chlorospila around the world. Yellow circles: occurrence data from GBIF. Red circle: new record of P. chlorospila in Assam, India.
Ecology. The species was found growing on smooth bark of *Lannea* sp.

Remarks. *Pyrenula chlorospila* is similar with *P. macrospora* (Degel.) Coppins & P. James. (Weerakoon et al. 2012), in its thallus colour, presence of pseudocyphelae on the thallus and absence of chemicals in TLC. Both of the species luxuriously grow on smooth bark of the trees. On the other hand, both of the species differs with their ascomata size. *Pyrenula chlorospila* has 0.1–0.4 mm diameter ascomata but *P. macrospora* has ascomata size approximately 0.5–0.9 mm in diameter (Orange 2013). Globally, *P. chlorospila* is reported from Denmark, France, Germany, Greece, Iran, Ireland, Isle of Man, Malta, the Netherlands, Russian Federation, Spain, Ukraine (GBIF 2022) (Fig. 1).

Discussion

*Pyrenula* species mostly prefer to grow on the smooth bark of *Alnus, Quercus,* and *Ficus* species (Ingle et al. 2018), and in India, most *Pyrenula* species have been found on the smooth bark of *Lannea* sp. and some on the bark of species of *Artocarpous, Mangifera, Michelia, Polyalthia,* and *Ricinus.* Based on the literature (Awasthi 1961; Rout et al. 2005, 2010, 2012; Singh and Sinha 2010; Das et al. 2012, 2013; Gupta et al. 2013; Daimari et al. 2014; Dey et al. 2015; Choudhury et al. 2016; Gupta and Sinha 2018; Gogoi et al. 2019; Joseph et al. 2020; Behera et al. 2021), our record of *P. chlorospila* represents a new addition to the lichen biota of India. With this addition, 12 species of *Pyrenula* have been recorded from Dhubri district (Table 1). As the district is mainly plain with deciduous vegetation, crustose lichens are dominant, although a few foliose genera, *Dirinaria, Pyxine,* and *Parmotrema,* also occur.

Acknowledgements

We are thankful to the Botany Department, Bodoland University for providing the facilities to carry out our research and the Director of CSIR – National Botanical Research Institute, Lucknow for permitting access to the LWG herbarium and library. We are also thankful to Mr. Sanswraig Basumatary for his help and suggestions. Rebecca Daimari is thankful to Department of Science and Technology – Science and Engineering Research Board, New Delhi, India for financial assistance under the EMEQ scheme (EEQ/2019/000547).
