Abstract
We report new distribution records of Redside Barb (*Puntius bimaculatus*), a species of freshwater fish, for the first time from the Nallamala Hill Ranges of Nagarkurnool and Nalgonda districts (Telangana state), and the Seshachalam Hills in Kadapa district (Andhra Pradesh). We provide a brief description of earlier reports and a detailed description of this species.

Keywords
Freshwater fish, Kadapa, Krishna River, Nagarkurnool, Nalgonda, Pennar River.

Introduction

Freshwater fishes of the genus *Puntius* Hamilton-Buchanan, 1822 are abundant and exhibit a high degree of variability in their morphology (Jayaram 1991, Talwar and Jhingran 1991). The genus consists of about 75 species of small to medium-sized barbs found in stagnant pools to fast-flowing streams of the Indian subcontinent (Jayaram 2010). The species of *Puntius* have been placed into 10 groups based on their geographical distribution and 14 complexes based on their external characters and color patterns (Jayaram 1991, 2010). Species of *Puntius* occurring in India and Sri Lanka show different color patterns and exhibit variability in their characters. *Puntius bimaculatus* (Bleeker, 1863) is one of such species, commonly known as Redside Barb. It is distributed in Sri Lanka and southern India. It was originally described as *Gnathopogon bimaculatus* by Bleeker (1863) based on specimens from Sri Lanka, and as the type locality is not known with precision, it is attributed as only "Sri Lanka". One species, *Puntius puckelli* Day, 1868, which was described from Bangalore and earlier treated as a synonym of *Puntius dorsalis* Jerdon, 1849, vide Hora 1936, was treated by Menon and Devi (1992) as a synonym of *P. bimaculatus*. *Puntius bimaculatus* has been reported from Sri Lanka, and river basins in the Western Ghats in Kerala, Karnataka, Tamil Nadu, and Maharashtra (Pethiyagoda 1991, Jayaram 1991, Arunachalam 2000, Devi et al. 2005, Raghavan et al. 2008, Johnson and Arunachalam 2009, Pethiyagoda et al. 2012). There are occasional sightings and collections of this species outside the Western Ghats, including 1 in the Yercaud

Figure 1. *Puntius bimaculatus* (Redside Barb) in life.

sub-basin (Arunachalam et al. 2000a, Ramanujam 2015), 1 in the Cauvery river basin in Tamil Nadu (Jayaram et al. 1982), and another in the Gundlakama river sub-basin in Andhra Pradesh (Sharma and Nayak 2006). Fewer scientific records are available for the *P. bimaculatus* in the Eastern Ghats as compared to the Western Ghats (Dahanukar et al. 2004). Hence, we aim to fill this lacuna regarding the occurrence of *P. bimaculatus* in the Eastern Ghats. We report the first records of *P. bimaculatus* in the Krishna river basin of Telangana state, and the Pennar river basin in the Eastern Ghats of India.

Methods

We conducted a random sampling survey of the fish diversity in the Nallamala Hills in Nagarkurnool and Nalgonda districts in Telangana, and Seshachalam Hills in Kadapa district, Andhra Pradesh, India (study and collection permit Rc. No.10873/2015/WL-2, dated.16.09.2015). We collected fishes using cast-nets. We also obtained fishes from local tribes, who used traditional fish traps. Collected specimens were labelled and fixed in 7% formalin (Jayaram 2010). We recorded the coordinates of the locations using a Garmin GPS (model GPS 72H, accuracy ±15 m). The fishes were identified following Jayaram (1991, 2010), Raghavan and Ali (2013), Ramanujam (2015), and Froese and Pauly (2018). Morphometric measurements, to the nearest 0.1 mm, were taken using Mitutoyo digital calipers following Jayaram (2010) and Armbruster (2012). Morphometric measurements such as total length, standard length and head length are presented in mm, while others are expressed as a percentage of either standard length or head length. Voucher specimens are deposited in the Natural History Museum, Department of Zoology, University College of Science, Osmania University, Hyderabad, Telangana state, India.

Results

***Puntius bimaculatus* (Bleeker, 1863)**

New records. India. **Telangana state.** Nalgonda district: stream near Rekulagadda village (16°30.225′N, 079°02.835′E; alt. 370 m a.s.l.), collector: Kante Krishna Prasad, 20-09-2015 (2 specimens: NHM.OU.F-K.21-2015, NHM.OU.F-K.22-2015). Nalgonda district: stream near Devaracharla Village (16°30.525′N, 079°02.342′E; alt. 370 m a.s.l.), collector: Kante Krishna Prasad, 20-09-2015 (2 specimens: NHM.OU.F-K.23-2015, NHM.OU.F-K.24-2015). Nagarkurnool district: Krishna River near Pathalaganga, Eagalapenta (16°05′53″N, 78°54′28″E; alt. 170 m a.s.l.), collector: Kante Krishna Prasad, 21-09-2015 (1 specimen: NHM.OU.F-K.25-2015). **Andhra Pradesh.** Kadapa district: stream near Yerraguntla Kota (13°57′10″N, 079°17′21″E; alt. 220 m a.s.l.), collector: Kante Krishna Prasad, 16-11-2017 (4 specimens: NHM.OU.F-P.01-2017 to NHM.OU.F-P.04-2017).

Identification. *Puntius bimaculatus* can be distinguished from other species of *Puntius* primarily in its convex dorsal profile; small subterminal mouth with thick lower lip; 1 pair maxillary barbels; dorsal fin inserted nearer to the tip of the snout; last unbranched dorsal ray weak, articulated; dorsal fin base greater than least depth of caudal peduncle; presence of a black spot at base of third to eighth branched rays of the dorsal fin; lateral line complete; presence of a prominent black spot on caudal peduncle located on 23rd to 24th lateral line scales; predorsal scales 8 to 10; scales between lateral line and dorsal fin base 3½; lateral line and pelvic fin base 2½; pectoral fins do not extend to the origin of pelvic fins; pelvic fins not reaching anal fins; anal fin not reaching base of the caudal fin. Detailed morphometric measurements, ratios, and meristic counts are provided in Table 1.

Table 1. Morphometric characters (in mm) and meristic counts of the *P. bimaculatus* from the Krishna and Pennar River basins, India. Morphometric characters of from 4–22 are percentage of standard length of the fish and 23–27 are percentage of the head length of the fish.

Morphometric character	Krishna river Basin (*n* = 5)		Pennar river basin (*n* = 4)	
	Average (SD)	Range	Average (SD)	Range
TL—total length (mm)	45.40 (4.1)	39.79–49.96	50.30 (4.57)	46.18–56.65
SL—standard length (mm)	36.00 (3.16)	31.74–39.38	39.30 (3.68)	36.19–44.32
HL—head length (mm)	9.58 (1.14)	7.93–10.93	10.60 (1.30)	9.20–12.32
% SL

Inter orbital width	36.94 (2.59)	34.53–40.06	35.16 (1.29)	33.86–36.74
Meristic counts				
Lateral line scales (LL)		24–25		23–25
Scales between LL and dorsal fin base		3½		3½–4
Scales between LL and anal fin base		2½		2½
Predorsal scales		8–10		8–9
Prepelvic scales		6–7		6–7
Preanal scales		12–14		13–15
Dorsal fin rays		ii+7		ii+7
Pectoral fin rays		i+10–11		i+10–11
Pelvic fin rays		ii+7–8		ii+7–8
Anal fin rays		ii+5		ii+5
Caudal fin procurrent rays		12–14		12–16
Caudal fin principal rays		19		19

Live colour. Dorsal and lateral aspects olive-green and abdomen silvery. A prominent black spot near flexure line of caudal fin, and another on dorsal fin base (Fig. 1). Scale margins brown. Adults show a crimson band on lateral side during the breeding season.

Discussion

Puntius populations in peninsular India, which were assigned to *P. bimaculatus*, show differences from those in Sri Lanka, where *P. bimaculatus* sensu stricto was described. *Puntius* from Bangalore, India, showing 2 spots on the body were initially described as *P. puckelli* by Day (1868), which was tentatively treated as a synonym of *P. bimaculatus* sensu lato (Menon and Devi 1992). *Puntius bimaculatus* sensu stricto from Sri Lanka have been reported to have 3 unbranched and 7 branched rays in the dorsal fin (Günther 1868), while *P. bimaculatus* sensu lato from peninsular India has been reported to have 1 unbranched and 7 branched rays (Jayaram 1991). Our specimens exhibit differences from those reported earlier (Günther 1868, Jayaram 1991). They are smaller both with respect to head length (HL: 28.21–36.36 mm vs 25.42–27.76 mm) and body depth (BD: 26.78–30.68 mm vs 24.61–28.63 mm). Interestingly, the specimens from the Pennar river basin have slightly larger body depth than those from the Krishna river basin (BD: 25.92–28.63 mm vs 24.61–26.47 mm). Our specimens also

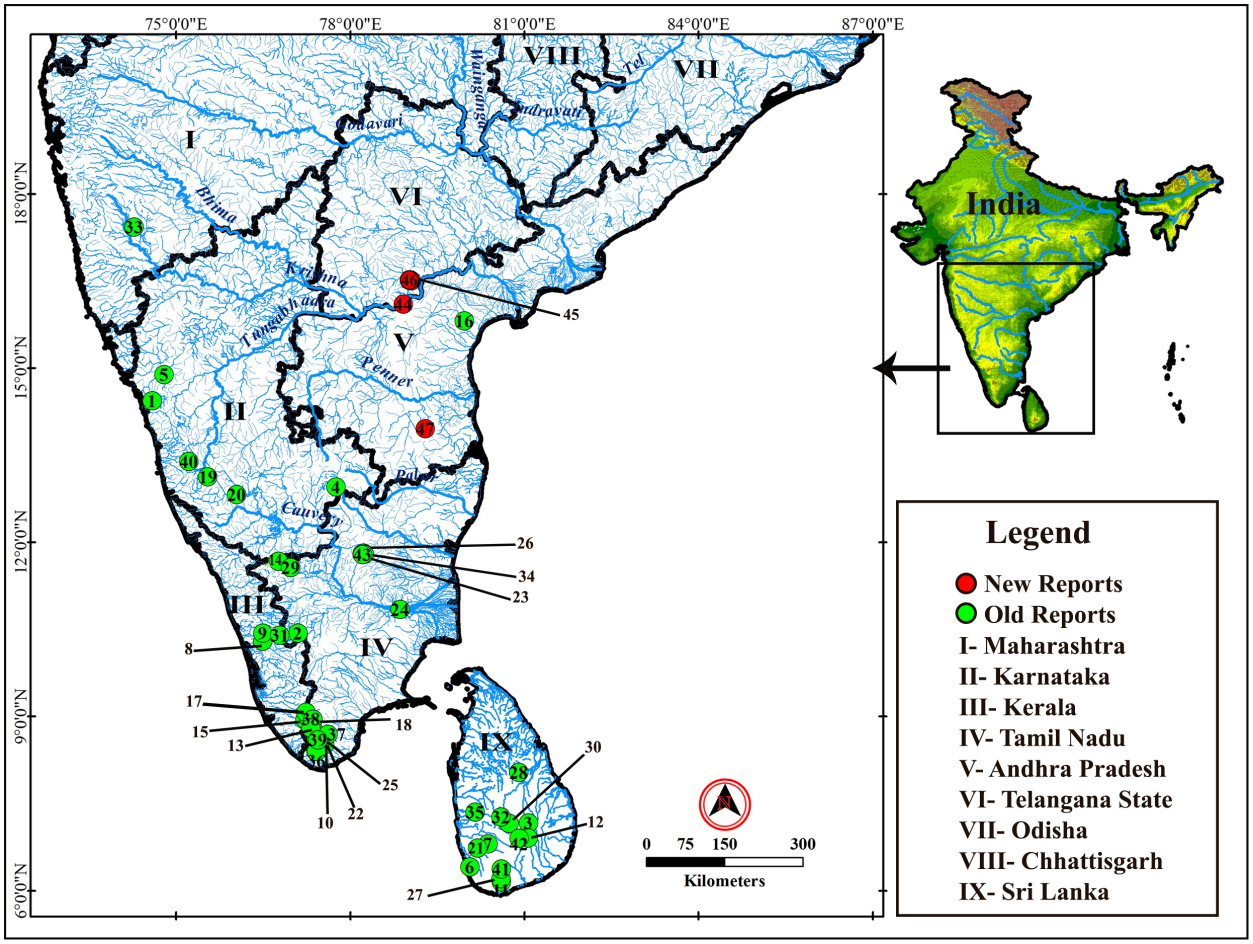

Figure 2. Distribution of the *Puntius bimaculatus,* numerical numbers with green circle show earlier reports in India and Sri Lanka. Numerical numbers with red circles show new locality reports from Andhra Pradesh and Telangana state, India. Numerical numbers in the map represent serial numbers in the Table 2.

varied from the other Indian populations (see Jayaram 1991) in possessing 2 unbranched and 7 branched rays (vs 1 unbranched and 7 branched rays) in dorsal fin; 2 unbranched and 7 or 8 branched rays (vs 1 unbranched and 8 branched rays) in pelvic fin; and 12 circumpeduncular scales (vs 10 or 11 scales).

The new sites reported by us extends the distribution of the *P. bimaculatus* further north into the Eastern Ghats and constitutes the second report of this species in the Krishna river basin and the first report from Pennar river basin in the eastern peninsular India. This species has been reported from many localities in the Western Ghats from Phansad, Maharashtra (Arunachalam 2000) in north to Samikutchi Falls, Chittar River, Tamil Nadu in south (Fig. 2, Table 2). It has a discontinuous distribution in the Eastern Ghats, with the northernmost distribution reported from Gundlakamma River, Andhra Pradesh (Sharma and Nayak 2006). The detection of *P. bimaculatus* from 2 new sites is indicative of the Wallacean shortfall, which could generally be applicable to most species of hill stream fishes. *Puntius bimaculatus* could be more widespread than currently known. Although this species has value in the aquarium trade, its presence in the Eastern Ghats has not been well studied. Unexplored areas should be searched and taxonomic and ecological studies are necessary.

Acknowledgements

We acknowledge the Principal Chief Conservator of Forests, Chief Wildlife Warden, Telangana Forest Department, Telangana State for the study-and-collection permit. We also thank the Head, Department of Zoology, Osmania University, Hyderabad for access to facilities under University Grants Commission (UGC)-Special Assistance Programme II (Department of Special Assistance-I) and Department of Science and Technology, Fund for Improvement of Science and Technology Programme in Zoology. KP acknowledges research funding from UGC, New Delhi. We thank Yeluka Venkateshwarlu and Tariq Ahmed Shah for assistance during the surveys.

Authors' Contributions

KP conducted the field study, identified the species, prepared the map and the first draft of the manuscript. CS supervised the research and prepared the final version of the manuscript.
