## Abstract

We report the herbaceous plant *Phyllanthus tenellus* Roxb., a species native to tropical regions, from Morocco. This is the first time that the genus and species are reported from Morocco and continental North Africa. We found this species to be naturalising in several localities in north-western Morocco. A morphological description, the geographic distribution, and notes on the ecology of this species are provided. We present for the first time photographs of *P. tenellus* from continental North Africa.

## Keywords

Alien flora, chorology, Euphorbiaceae s. lat., Malpighiales, Morocco, new records, North Africa

## Introduction

The vascular flora of Morocco remains one of the best studied and most comprehensively listed floras of continental North Africa on the southern shore of the Mediterranean Basin (e.g., Jahandiez and Maire 1931, 1932, 1934; Emberger and Maire 1941; Benabid 1985, 2000; Fennane and Ibn Tattou 1998, 2005, 2012; Benabid and Fennane 1994; Médail and Quézel 1999; Fennane et al. 1999, 2007, 2014; Valdés et al. 2002; Ibn Tattou and Fennane 2008; Dobignard and Chatelain 2010, 2011a, 2011b, 2012, 2013; Chambouleyron 2012; Rankou et al. 2013, 2015, 2018). Nevertheless, investigators have been repeatedly surprised by the number of new additions to

this flora. At least 16 taxa have been newly reported for the flora of Morocco and/or to science in the last nine years (Martínez-Rodríguez and Crespo 2013; Chambouleyron et al. 2014, 2015; Alonso et al. 2015; Dobignard 2015; Crespo et al. 2016; Brullo et al. 2017; Sant et al. 2017; Khamar et al. 2017, 2021; Essokne et al. 2018; Garcin 2019; Koch and Lemmel 2019; Chatelain et al. 2020; Homrani-Bakali and Peltier 2020; Homrani-Bakali and Susanna 2021). These new discoveries demonstrate the importance of field investigations and show that many phytogeographic sectors of the Moroccan territory still remain underrepresented in botanical surveys.

During recent botanical surveys that we conducted in several parts of the Morocco–North Atlantic phytogeographical region (Man, Man-3, Fennane and Ibn Tattou 1998) (Fig. 1) we encountered some unfamiliar specimens, which, after review of relevant literature (Coode et al. 1982; Ralimanana 2007; Silva and Sales 2007, 2008; Ralimanana and Hoffmann 2011), were found to correspond well to *Phyllanthus tenellus* Roxb. The genus *Phyllanthus* L. (Phyllanthaceae, Phyllanthoideae, Phyllanthaeae) has never previously been reported in Morocco (Vindt 1953, 1960; Valdés et al. 2002; Fennane et al. 2007; Dobignard and Chatelain 2013). Hence, our collection of *P. tenellus* represents the first records of the genus *Phyllanthus* and the species from Morocco.

## Methods

Fieldwork was carried out from September 2020 to December 2021. Specimens of *Phyllanthus tenellus* were examined and photographed in the field. Identification was done by consulting the protologue (Roxburgh 1882), other descriptions, identification keys, and other references on *Phyllanthus* (Coode et al. 1982; Ralimanana

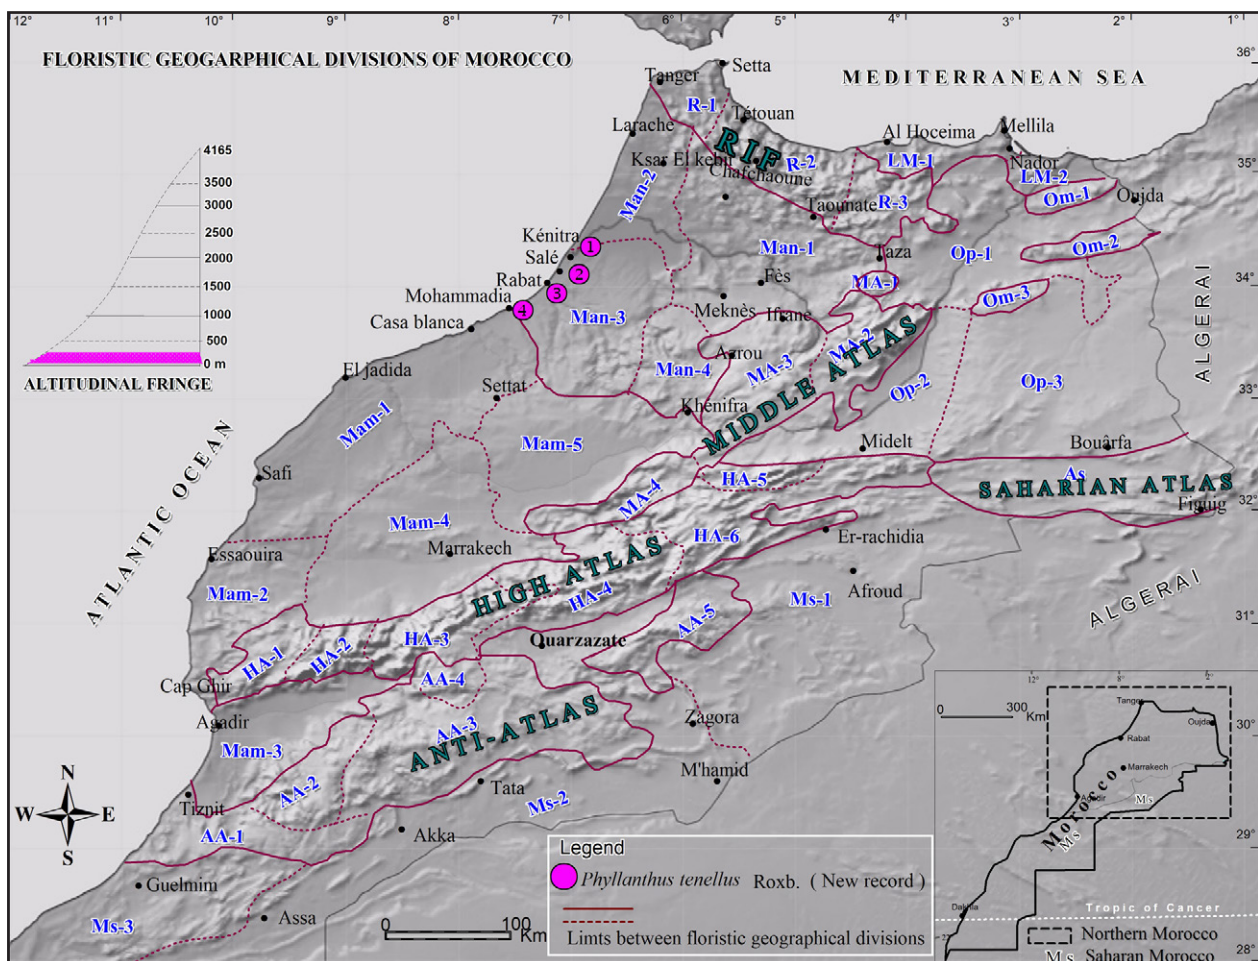

2007; Silva and Sales 2007, 2008; Ralimanana and Hoffmann 2011), as well as consulting images of the type specimen. We noted data on populations, distribution, geographic coordinates, and habitats during the field surveys. Voucher specimens were deposited in the National Herbarium of Scientific Institute–Rabat (RAB; acronym according to Thiers 2021). The nomenclature follows Govaerts (2021) and POWO (2021).

## Results

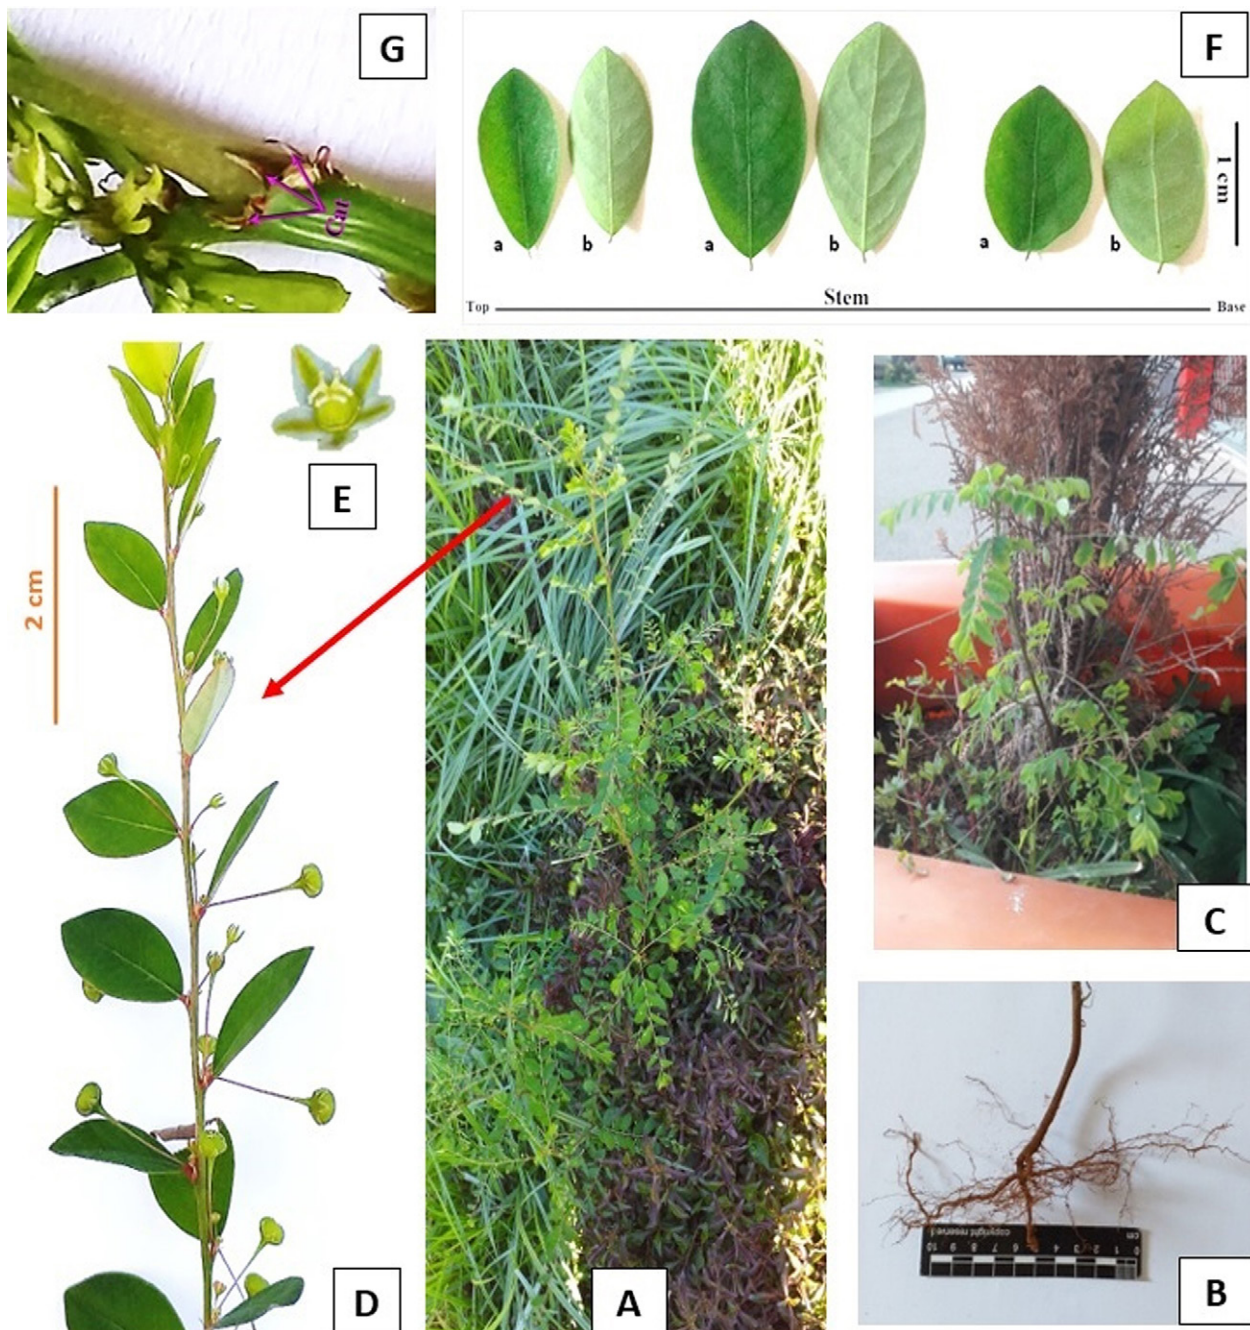

***Phyllanthus tenellus* Roxb.** Flora Indica 2(3): 668 (Roxburgh 1882). Type: India. Calcutta, Wallich 7892 A (holotype K001128401; sheet available at <http://specimens.kew.org/herbarium/K001128401>).

**Identification** (Fig. 2). Annual herbaceous, monoecious. Stems terete, dressed, entirely glabrous or slightly scabridulous, usual height 15–50 cm but occasionally up to

150–200 cm high under favourable conditions; plagiotropic branches, terete, broad-leaved. Cataphylls triangular coriaceous, entire, glabrous. Leaves 6–25 × 4–11 mm; alternate, blade elliptical to obovate, margins entire, flat, wavy, attenuate at the base, acute to obtuse at apex, glabrous on both surfaces; petioles 0.5–1.0 mm long. Stipules not auriculate, membranous, persistent, triangular, reddish-brown, glabrous; petiole terete <1 mm long. Flowers: Solitary or 2 or 3 males and 1 or 2 females together, fruiting pedicels 4–10 mm long, perianth segments narrowly ovate, about 1 mm long, margins broad, white, not enlarging under fruit. Stamens: 5, filaments free. Capsule 1.5–2.0 mm diameter, globose,

greenish, smooth. Seeds about 1 mm long, brown, dorsally minutely tuberculate in longitudinal rows (see also Ralimanana 2007; Silva and Sales 2007; Ralimanana and Hoffmann 2011).

**Distribution and habitat.** *Phyllanthus tenellus* is native to Angola, Comoros, Madagascar, Mauritius, Mozambique, Réunion, Saudi Arabia, Tanzania, and Yemen (Coode et al. 1982; Zare et al. 2015; Hariri et al. 2020a), but it is regarded as an alien or naturalised plant in at least 30 countries (POWO 2021) (Fig. 3). Throughout its native lands, *P. tenellus* occupies varied habitats, including open forests, forest margins, littoral forests, and cultivated fields (Coode et al. 1982; Ralimanana 2007), at altitudes from sea level to about 2050 m a.s.l. (Ralimanana and Hoffmann 2011). Frequently, it is linked to wet places with deep, rotten humus and also in sandy alluvial flats along rivers (POWO 2021). However, where introduced, it usually has been observed in pots of ornamental exotic plants, near plant nurseries, in gardens, along roadsides, and at the edges of waterways (Crisafulli et al. 2011; Zare et al. 2015; Hariri et al. 2020b).

Near Morocco, this species has been reported from the Azores, Madeira, Cape Verde (Hansen and Sunding 1993; Schäfer 2003; Silva et al. 2005), and Canary islands (PadrónMederos et al. 2009), as well as Corsica (Jeanmonod 2000) and Italy (Crisafulli et al. 2011).

So far, *P. tenellus* has been observed from four sites in north-western of Morocco: Mohammadia, Rabat, Sale, and Kenitra (Fig. 1). The bioclimate in this zone is between subhumid to semi-arid Mediterranean with a temperate winter, annual rainfall of barely 400 mm, and average annual temperatures between 13 and 23 °C (Bendaanoun 1991). At the places surveyed, we found this species growing in urban ecosystems such as roadsides, gardens, and open areas, as well as in several pots of ornamental exotic plants exhibited next to coffee shops and restaurants. The altitudinal range of our new records is 8–100 m a.s.l.

In the vicinity of Mohammadia City, we found about

15 individuals *P. tenellus* living in reddish-brown sandy and clay-loam soil on a roadside where it was mixed with the following species: *Verbascum sinuatum* L., *Silybum marianum* (L.) Gaertn., *Ricinus communis* L., *Urtica urens* L., *Verbesina encelioides* (Cav.) Benth. & Hook. f. ex A. Gray, *Solanum linnaeanum* Hepper & P.-M. L. Jaeger, *Solanum elaeagnifolium* Cav., *Diplotaxis tenuifolia* (L.) DC., and low grasses.

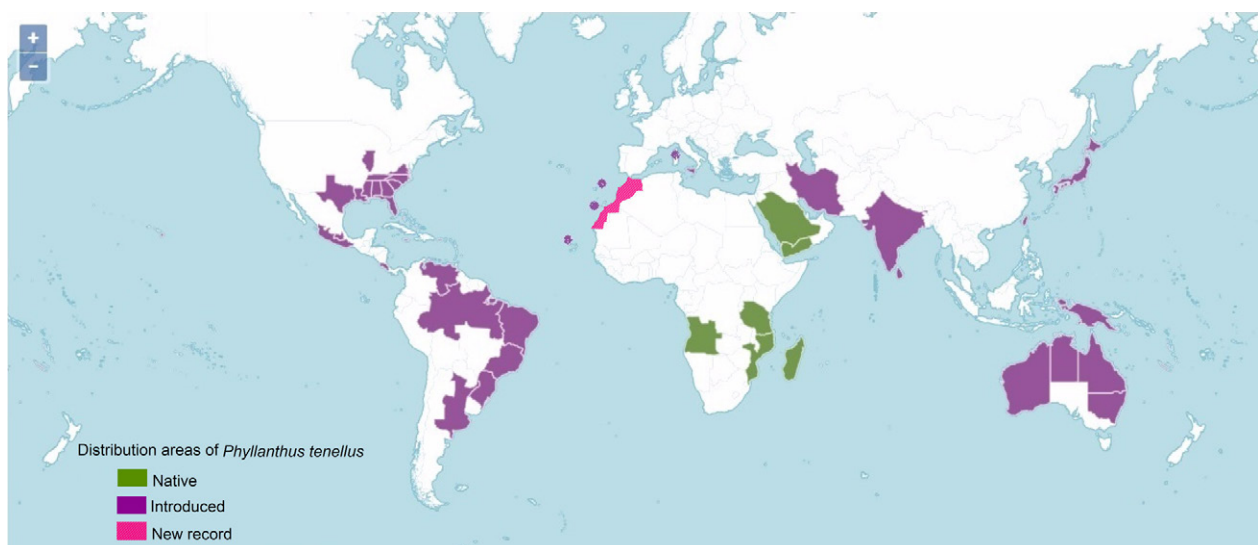

However, in the Rabat region, *P. tenellus* was found on clayey-sandy, more or less moist soil at about 100 m a.s.l. At this site, about 30 plants were found in association with *Mercurialis annua* L., *Euphorbia peplus* L., *E. lathyris* L., *E. paniculate* Desf., *E. terracina* L., *E. hirta* L., *Verbascum sinuatum* L., *Lupinus atlanticus* Dladst., *Lotus arenarius* Brot., *Ononis laxiflora* Desf., *Erigeron canadensis* L., *Plantago major* L., *Oxalis pes-caprae* L., *Emex spinosa* L., *Parietaria mauritanica* Durieu, *Urtica urens*, *Physalis philadelphica* Lam., and *Salpichroa origanifolia* (Lam.) Baillon.

In Sale, we first observed in pots with ornamental exotic plants, then eight individuals were located near plant nurseries on clayey-sandy soil.

In some places in Kenitra, we collected flowering *P. tenellus* plants from two wet locations at sea level and about 20 m a.s.l. on limestone and sandstone substrates. At these two sites, we inventoried over 50 plants of this species. Accompanying species include *Emex spinosa*, *Parietaria mauritanica* Durieu, *Diplotaxis tenuifolia*, *Oxalis pes-caprae*, *Gamochaeta antillana* (Urb.) Anderb. and *Salpichroa origanifolia*. In addition, numerous individuals have been observed in several pots of ornamental exotic plants at coffee shops and restaurants.

## Discussion

*Phyllanthus tenellus* was first described by Roxburgh (1882) from material introduced from Mauritius in 1802 by Captain Tennant. In the most recent classification of the genus, supported by molecular phylogenetic data

**Figure 3.** General distribution areas of *Phyllanthus tenellus* (modified from POWO 2021).

(Bouman et al. 2018, 2021), *P. tenellus* is classified in the pan-tropical subgenus *Tenellanthus* Jean F. Brune, but with its origin in Africa.

Dobignard and Chatelain (2013) treated Phyllanthaceae as a family among the 156 botanical families which constitute the vascular flora of Morocco, and with the Phyllanthaceae only represented there by one genus, *Andrachne* L. and three species—*A. aspera* Sprengel, *A. telephooides* L., and the Moroccan endemic *A. maroccana* Ball. However, Fennane et al. (2007) classified this genus in Euphorbiaceae sensu lato. Our collections of *P. tenellus* from Morocco are the first time that this species and the genus *Phyllanthus* have been recorded from the country. Thus, we increase the number of genera of Phyllanthaceae in Morocco to two: *Andrachne* and *Phyllanthus*.

In our field surveys we frequently observed *P. tenellus* in pots of exotic ornamental plants. All four of the cities that we surveyed (Mohammadia, Rabat, Sale, and Kenitra) are known for the presence of nurseries of exotic and decorative plants imported from other countries, especially from tropical regions. Thus, *P. tenellus* is thought to have been introduced accidentally through the exotic plant trade as a contaminant in the soil and then escaped from gardens and nurseries into the wild, where it readily reproduced and spread. The introduction of *P. tenellus* to Morocco is consistent with several other areas where this species has also been introduced, for example, the Azores, Madeira, and the Cape Verde Islands (Hansen and Sunding 1993; Schäfer 2003; Silva et al. 2005), Corsica (Jeanmonod 2000), the Canary Islands (Padrón Mederos et al. 2009), Italy (Crisafulli et al. 2011), Iran (Zare et al. 2015), and Sumatra (Hariri et al. 2020a).

For some time now, biological invasions have been a very topical issue worldwide affecting flora and habitats (Laface et al. 2020; Musarella et al. 2020; Nagy et al. 2020; Rosati et al. 2020; Stinca et al. 2021; Tarkan et al. 2021). Africa is also interested in this issue (UICN/PACO 2013). However, although taxonomical research on naturalized and invasive plants has received occasional attention in some African countries, the diversity and abundance of invasive plants in relation to land use are still poorly documented (Foxcroft et al. 2010; Amah et al. 2019). In this context, inventory of newly recorded xenophytes is the main first step to the monitoring and potentially control of invasive alien plant species (Richardson and Wilgen 2004; Latombe, et al. 2017). In recent decades, plant invasions have not given importance in Morocco and the word “invasive” has rarely been mentioned in most documents and reports. Although there is no official list of invasive alien plants in Morocco, Tanji and Taleb (1997) did publish the first list of 12 plants. Currently, 29 invasive species are known (Bouhache and Taleb 2012), and more than half of these have invaded cultivated fields, while 27.6% were found in uncultivated land and the remaining 22.4% have invaded both environments (Taleb 2015; Ben-Ghabrit et al. 2019). The origins of the introductions are diverse; about 31% of

Morocco’s invasive alien plants come from the United States, about 38% from the Mediterranean Basin or Africa, and about 31% have their origins in Europe, Asia, and Australia (Ben-Ghabrit et al. 2019). The majority (66.6%) of these invasive alien plants in Morocco were introduced between 1930 and 2000, while the remaining species are neophytes.

The occurrence of a newly naturalising xenophyte, *P. tenellus*, reveals the need for continued botanical explorations of different ecosystems, with a special emphasis on disturbed ones, such as urban areas which are less attractive to researchers. Additionally, due to its ethnobotanical value and the richness of its bioactive ingredients (Silva et al. 2010, 2012; Victório et al. 2011; Sarin et al. 2014), *P. tenellus* may be found useful for future phytochemical and pharmacological investigations in Morocco.

## Acknowledgements

We gratefully thank the curators of the National Herbarium, Rabat, Morocco (RAB), for facilitating specimens for examination. We also appreciate the constructive criticisms and suggestions provided by anonymous reviewers and academic editor that much improved the manuscript.
